Week 9 – Introduction to LangGraph

Multiple Choice Questions

Q1. What is the primary purpose of LangGraph?

A. To create vector databases

B. To build workflow-based LLM applications using graphs

C. To train Large Language Models

D. To create embeddings

Q2. In LangGraph, what does a State represent?

A. The API key used by the application

B. The shared data passed between Nodes

C. The database schema

D. The model parameters

Q3. Which of the following information is typically stored in a LangGraph State?

A. User question and generated answer

B. GPU temperature

C. Operating system version

D. Python installation path

Q4. What is a Node in LangGraph?

A. A machine learning model

B. A function that performs a specific task on the State

C. A vector database

D. An API endpoint

Q5. What is the primary responsibility of a Node?

A. Store embeddings permanently

B. Modify or process the application's State

C. Install Python packages

D. Generate API keys

Q6. What do Edges define in a LangGraph?

A. The programming language used

B. The execution flow between Nodes

C. The size of the vector database

D. The model's context window

Q7. What happens if two Nodes are not connected by an Edge?

A. Both Nodes execute simultaneously

B. The second Node will not execute through that workflow

C. The application automatically creates the connection

D. The graph becomes a vector database

Q8. A LangGraph application has the following Nodes: Retrieve Documents, Generate Answer, and Evaluate Response. Which component specifies that these Nodes execute in the correct sequence?

A. State

B. Edges

C. TypedDict

D. Prompt Template

Q9. Which Python data structure is commonly used to define a State in LangGraph?

A. Tuple

B. TypedDict

C. Set

D. String

Q10. Which of the following best describes a Graph in LangGraph?

A. A collection of Nodes connected by Edges that define workflow execution

B. A table stored in SQL

C. A collection of embeddings

D. A list of prompts
